1.0 INTRODUCTION

1.1 Pretreatment Program Background

The U.S. Environmental Protection Agency's (USEPA) General Pretreatment Regulations require local limits for Publicly Owned Treatment Works (POTWs) that implement federally approved pretreatment programs and for any other POTWs that are experiencing recurring pass through and interference problems.

Under the USEPA's local limits policy, each POTW must assess all of its industrial discharges and employ sound technical procedures to develop defensible local limits that will assure the POTW, its personnel, and the environment are adequately protected. The elements of an assessment include identifying all industrial users, determining the character and volume of pollutants in their discharge, and identifying pollutants of concern through a sampling, monitoring and analysis program. For each pollutant of concern, the POTW must then determine the Maximum Allowable Headworks Loading and implement appropriate local limits to ensure that the maximum loadings are not exceeded. The specific technical approach and method of control are left to the judgment of the POTW.

With respect to national standards for pretreatment, there are two sets of standards, namely Prohibited Discharge Standards and Categorical Pretreatment Standards. Prohibited Discharge Standards prohibit the discharge of wastewater that would pass through or interfere with POTW operation including sludge management. These are the general prohibitions. There are also specific prohibitions that prohibit the discharge from all non-domestic sources of certain types of wastewater that 1) are a fire or explosion hazard in the collection system or treatment plant 2) are corrosive, including any discharge with a pH less than 5.0 s.u., unless the POTW is specifically designed to handle such wastes, 3) contain solid or viscous pollutants in amounts that will obstruct the flow in the collection system or treatment plant, resulting in interference with operation, 4) contain pollutants in quantities sufficient to interfere with POTW operation and 5) have a temperature above 104 degrees F (40 degrees C) when reaching the treatment plant, or hot enough to interfere with biological operations.

Categorical pretreatment standards are technology-based limitations on industrial discharges to POTWs promulgated by EPA in accordance with Section 307 of the Clean Water Act. Categorical pretreatment standards apply to specified process wastewaters generated by particular industrial categories.

Local limits supplement the Prohibited Discharge Standards and Categorical Pretreatment Standards. Local limits are necessary in cases where an industry is not covered by categorical standards, or where categorical standards are not adequate to protect the POTW or receiving stream or to prevent undue contamination of the POTW sludge. Local limits are needed to implement three fundamental objectives of the National Pretreatment Program:

1. Prevent the introduction of pollutants into the POTW that could interfere with its operation,

2. Prevent pass-through of untreated pollutants that could violate applicable water quality standards or National Pollutant Discharge Elimination System (NPDES) effluent limitations,

3. Prevent the contamination of POTW sludge that would limit the selected sludge uses or disposal practices.

The term Pretreatment refers to the requirement for non-domestic sources that discharge wastewater to POTWs to control their discharges in order to meet limits established by EPA, the state or local authority on the amount of pollutants allowed to be discharged. The control of the pollutants may necessitate treatment prior to discharge to the POTW. Limits may be met by the non-domestic source through pollution prevention techniques or treatment of the wastewater.

1.2 Purpose and Scope of Local Limitations Re-Evaluation

The Industrial Pretreatment Program of the Municipal Sanitary Authority of the City of New Kensington (MSANK) was developed in 1993 and approved by the USEPA in 1994. The Pennsylvania Department of Environmental Protection (PaDEP) issued renewal NPDES Permit PA0027111 to MSANK on June 24, 2012. This permit is effective from July 1, 2010 to June 30, 2015. The purpose of this Headworks Analysis for Local Limits Reevaluation report is to address requirements in Part C, Item D of the NPDES permit, which requires MSANK to submit a reevaluation of their system to the USEPA and the PaDEP based on a Headworks Analysis of its treatment plant.

The scope of the Headworks Analysis for Local Limits Reevaluation included the following tasks:

1. Identification of all regulated industrial and commercial users with discharges that potentially could have an effect on the MSANK treatment plant processes.

2. Conducting a Headworks Analysis sampling program over a five-day period. The sampling program involved collecting 24-hour composite and grab samples of treatment plant Influent, Effluent, Digester Influent, Background sources and treatment plant Sludge.

3. Evaluation of the results of the Headworks Analysis sampling program to determine allowable amounts of priority pollutants at the MSANK treatment plant.

4. Calculation of revised local limits for the industrial users based on the allowable amounts of priority pollutants at the treatment plant.

5. Evaluation of the potential impact of the revised local limits on the MSANK pretreatment program.

2.0 WASTEWATER TREATMENT PLANT PROCESSES

MSANK is responsible for the operation and maintenance of a sewage treatment plant rated at 6.0 MGD, approximately 63.1 miles of collector and interceptor sewers, six (6) combined sewer overflows (CSO's), and three pump stations in the City of New Kensington. MSANK also provides treatment and conveyance service to the City of Arnold which has 15 miles of collector sewers, two (2) CSO's and one pump station; the City of Lower Burrell which has 67.2 miles of collector sewers and eleven (11) sewage pump stations; and the Logans Ferry Heights section of Plum Borough with 5 miles of collector sewers. The MSANK treatment plant is located at 120 Logans Ferry Road, in New Kensington, Westmoreland County and operated by MSANK under Sewerage Permit Nos. 9079 - S, 9220 - S and 6572405 and NPDES Permit No. PA0027111. The Service Area Location Map is shown on **Figure 1.**

2.1 Wastewater Treatment Plant

The MSANK sewage treatment plant is an activated sludge plant designed to treat an average daily flow of 6.0 MGD. The treatment plant discharges treated wastewater into Pucketa Creek, approximately 200 feet upstream of its confluence with the Allegheny River. Wastewater flow is continuously measured using a magnetic flow meter located along the force main between the influent wastewater pump station and the grit removal facilities. A schematic of the treatment plant is provided as **Figure 2.**

2.2 Primary Treatment Processes

Preliminary and primary treatment processes at the MSANK treatment plant include grinding via a comminutor, grit removal, pre-aeration and sedimentation. The purpose of the primary treatment process is to reduce the organic loading to the secondary treatment processes.

2.3 Secondary Treatment Processes

Secondary treatment processes consist of activated sludge extended aeration followed by clarification. The purpose of the secondary treatment process is to removal organic material through biological treatment. The treated effluent is disinfected prior to discharge to the receiving stream. Chlorine gas is used as the disinfecting agent.

2.4 Sludge Handling Processes

Sludge handling activities consist of dissolved air flotation thickening, anaerobic digestion, and dewatering by a belt filter press. The sludge generated at the treatment plant consists of two types of sludge. Primary sludge is removed from the primary clarifiers and decanted in the primary sludge decant tank. The thickened sludge is then pumped to the anaerobic digesters for stabilization.

Secondary sludge is removed from the final clarifiers and thickened in the dissolved air flotation thickener unit prior to being pumped to the anaerobic digesters. Stabilized sludge from the anaerobic digesters is dewatered on a belt filter press, prior to landfill disposal.

2.5 Recent Wastewater Treatment Plant Modifications

The Headworks and Blower Building Project was substantially complete in 2010. The project resulted in improved process control and safer working conditions at the flow point of entry to the plant and with the relocation of secondary aeration blowers along with associated electrical power components to a new building located above the 100-year floodplain.

3.0 WASTEWATER TREATMENT PLANT PERFORMANCE

3.1 NPDES Permit Requirements

The routine monitoring performed at the MSANK sewage treatment plant is conducted in accordance with the NPDES permit requirements. The parameters currently being monitored along with the frequency of analysis and types of samples are indicated below:

MSANK Sewage Treatment Plant
NPDES Permit Monitoring Requirements

Parameter	Frequency	Sample Type
Total Flow	Continuous, Recorded	24 hour composite on influent and effluent
$CBOD_5$	Daily	
Suspended Solids	Daily	24 hour composite on influent and effluent
Fecal Coliform	Daily	Grab on the effluent
pH	Daily	Grab on the effluent
Chlorine Residual	Daily	Grab on the effluent

Parameter	Average Daily Limitation	Maximum Weekly Limitation
Total Flow	-	-
$CBOD_5$	25 mg/l / 1251 lb/day	37.5 mg/l/ 1877 lb/day
Suspended Solids	30 mg/l / 1501 lb/day	45 mg/l / 2252 lb/day
Fecal Coliform	200* / 2000 *May 1 – September 30	-
pH	6.0-9.0 s.u.	-
Chlorine Residual	1.0 mg/l	-

The operating performance of the MSANK treatment plant was evaluated through a review of analytical data obtained from the collection of samples for NPDES permit requirements. A summary of the MSANK Monthly Performance Summary for 2011 is included as **Table 1.** The MSANK treatment plant discharge was in compliance with the permit limitations consistently throughout 2011, except for exceedances of the CBOD and TSS monthly average and maximum weekly averages during March and exceedance of the CBOD monthly average limit in April.

3.2 Local Limits Monitoring Requirements

In accordance with the requirements of the Industrial Pretreatment Program, MSANK conducts influent, effluent and sludge sampling and analysis for the existing local limit parameters on a quarterly basis. A summary of the analytical results from the local limit monitoring conducted during 2011 is included as **Table 2.**

4.0 INDUSTRIAL USER INFORMATION

4.1 Definition of Industrial User

The MSANK Pretreatment Resolution defines an Industrial User as "a source of Indirect Discharge". An Indirect Discharge is defined as "the introduction of pollutants into the sewage treatment plant from any non-domestic source regulated under Section 307(b), (c), or (d) of the Federal Water Pollution Control Act, also known as the Clean Water Act, as amended, 33 USC 1251, et. seq." Under the resolution, a Significant Industrial User (SIU) of the wastewater disposal system of MSANK is defined as:

(a) All industrial users subject to Categorical Pretreatment Standards under 40 CFR 403.6 and 40 CFR Chapter I, Subchapter N; and

(b) Any other industrial user that:

1. Discharges an average of 25,000 gallons per average work day or more of process wastewater to the POTW, (excluding sanitary, non-contact cooling and boiler blowdown waste), or

2. Contributes a process wastewater which makes up five percent or more of the average dry weather hydraulic or organic capacity of the POTW treatment plant, or

3. Has in their wastewater toxic pollutants as defined pursuant to Section 307 of the Act of (State) statutes and rules, or

4. Is found by the City of New Kensington, Municipal Sanitary Authority of the City of New Kensington, state control agency or the USEPA to have significant impact, either singly or in combination with other contributing industries, on the wastewater treatment system, the quality of sludge, the system's effluent quality or air emission generated by the steam, or

5. Is designated as such by the Control Authority on the basis that the industrial user has a reasonable potential for adversely affecting the POTW's operation or for violating any Pretreatment Standard or requirements in accordance with 40 CFR 403.8(f)(6).

Upon finding that an industrial user meeting the criteria in Paragraph A of this section has no reasonable potential for adversely affecting the POTWs operation or for violating any pretreatment standard or requirement, the control authority may at any time, on its own initiative or in response to a petition received from an Industrial User, and in accordance with 40 CFR 403.8(f)(6), determine that such industrial user is not a Significant Industrial User unless the industrial user is classified as a Categorical industrial user.

4.2 Classification of Industrial Users Regulated Under the MSANK Pretreatment Program

During 2011, there were six (6) Significant Industrial Users permitted under the MSANK pretreatment program and one hundred and seventy one (171) commercial/industrial facilities included in the program.

A listing of the Significant Industrial Users currently regulated under the pretreatment program is included in **Table 3.**

A. Significant Industrial Users

During 2011, three Significant Industrial Users were located in the City of New Kensington including Citizens Ambulatory Care Center, Schreiber Industrial Development Company and Unifirst Corporation. Three Significant Industrial Users were located in the City of Arnold including Keystone Rustproofing, Inc., Castle Co-Packing and Farmland Foods. The City of Lower Burrell does not have any industrial facilities, however, a variety of commercial dischargers from this portion of the service area are regulated under the pretreatment program. Plum Borough has no industrial and no commercial dischargers permitted under the pretreatment program.

B. Categorical Significant Industrial Users

There was one (1) categorical SIU permitted under the Pretreatment Program during 2011. The categorical SIU was Keystone Rustproofing. Keystone Rustproofing is regulated under 40 CFR Part 413-Electroplating Subcategory and 40 CFR 433.17(a) Metal Finishing.

The address for this facility is as follow:

Keystone Rustproofing, Inc.
1901 Dr. Thomas Blvd.
Arnold, PA 15068

C. Non-categorical Significant Industrial Users

There were five (5) non-categorical SIUs permitted under the Pretreatment Program during 2003. These SIUs included Citizens Ambulatory Care Center, Farmland Foods, Schreiber Industrial Development Company, Castle Co-Packing Company, and Unifirst Corporation. Addresses for these facilities are as follow:

1. Citizens Ambulatory Care Center/
   Alle-Kiski Medical Center
   651 Fourth Avenue
   New Kensington, PA 15068

2. Farmland Foods
   2200 Rivers Edge Drive
   Arnold, PA 15068

3. Schreiber Industrial Development Company
   P.O. Box 691
   New Kensington, PA 15068

4. Castle Co-Packing
   Building 204-B
   Schreiber Industrial District
   Arnold, PA 15068

5. Unifirst Corporation
   1150 Second Avenue
   New Kensington, PA 15068

D. Non-Significant Industrial Users

There were a total of one hundred seventy one (171) non-significant industrial/commercial users regulated under the pretreatment program during 2011. These users consist primarily of restaurants, automotive care facilities, and other commercial establishments that discharge wastewater with the potential to affect the performance of the MSANK treatment plant.

4.3 Industrial User Flow Data

The flows for the Significant Industrial Users are based on either discharge flow meter readings or water meter readings reported to MSANK by the user.

5.0 EXISTING LOCAL LIMITATIONS

5.1 Basis of Existing Local Limitations

The existing local limitations for the pretreatment program were developed in 2005. The Significant Industrial Users were the same as the present except for changes in ownership. North Side Foods became Farmland Foods and Three Rivers Bottling Company became Castle Co-Packers.

6.0 CRITERIA FOR DEVELOPMENT OF REVISED LOCAL LIMITATIONS

6.1 Basis for Development of Revised Local Limitations

The methodology used to develop revised local limits for MSANK was consistent with the methodology recommended by the USEPA in the following:

> Guidance Manual on the Development and Implementation for Local Discharge Limitations under the Pretreatment Program, USEPA, Office of Water Enforcement and Permits, Washington, D.C., December 1987
>
> Local Limits Development Guidance, USEPA, Office of Wastewater Management 4203, EPA 833-R-04-002, July 2004

These documents are referenced throughout this study as USEPA Guidance Manual.

6.2 Headworks Analysis Sampling Plan

MSANK developed a Headworks Analysis Sampling Plan that was approved by USEPA on September 11, 2011. A copy of the sampling plan and the approval letter are included in **Appendix A**. The Headworks Analysis Plan was implemented as described below.

A. Pollutants Evaluated

MSANK evaluated a total of eighteen (18) parameters as part of the Headworks Analysis. The Headworks Analysis evaluation consisted of the "standard ten" parameters including Arsenic, Cadmium, Chromium, Copper, Cyanide, Lead, Mercury, Nickel, Silver and Zinc. Molybdenum and Selenium were also evaluated due to their inclusion in both EPA's and Pennsylvania's sludge quality programs. The other parameters for which MSANK currently has local limits also were evaluated including: Carbonaceous Biochemical Oxygen Demand ($CBOD_5$), Total Suspended Solids (TSS), Oil and Grease, and pH.

No additional toxic pollutants are included in the NPDES permit, nor have any other priority pollutants been detected at significant levels during the priority pollutant scans conducted as part of the quarterly monitoring required by the Pretreatment Program.

B. Sampling Points

MSANK utilized five sampling locations to conduct the Headworks Analysis. The sampling locations were:

1. Raw Influent
2. Influent to Digester
3. Final Effluent
4. Background samples solely from domestic sources
5. Dewatered Sludge

C. Number and Type of Sampling Events

1. Historical Sample Data

MSANK used historical monitoring data to supplement the samples collected for the Headworks Analysis. The use of historical data from 2006 through 2011 was used in the headworks analysis spreadsheet.

2. Sample Data

In order to assess current plant conditions, MSANK conducted sampling on a daily basis for a five-day period. Grab samples were collected for Cyanide, Oil and Grease. Temperature and pH were evaluated through on-site testing procedures. All other parameters were evaluated using 24-hour composite samples. Sample data included the following:

a. Raw Influent and Final Effluent

Five, 24-hour composite samples of the Raw Influent and Final Effluent samples were collected for analysis. These samples were analyzed for the twenty-two parameters referenced previously.

b. Influent to Digester

A total of five daily grab samples of Influent to Digester were collected and analyzed for the non-conservative parameter of Cyanide.

c. Background

Five, 24-hour composite samples of Background wastewater from domestic sources were analyzed for the parameters referenced previously. Two samples were collected from a background sampling location in New Kensington, and three samples were collected from a background sampling location in Arnold. Background sampling in the City of New Kensington was conducted at the intersection of McCargo Street (Manhole #51). Background sampling in the City of Arnold was conducted along Moore Street.

d. Sludge

Five samples of dewatered sludge were collected from the belt filter press area at the treatment plant. Sludge samples were collected on days when the Influent and Effluent samples were being collected.

D. Analytical Methods

A listing of the parameters and the analytical methods are as follows:

Parameter	Analytical Method	Parameter	Analytical Method
Arsenic	SW-846	Total Suspended Solids	SM-2540D
Cadmium	E-200.8EPA 213.2		
Chromium	E-200.8EPA 200.7	Oil and Grease	EPA 1664A
Copper	EPA 200.7	pH	SM-4500
Cyanide	SM-4500		
Lead	EPA-200.7	Mercury	EPA-245.1
Nickel	E-200.8	Silver	SW-846
		Carbonaceous Biochemical	SM 5210B
Zinc	SW-846	Oxygen Demand	
Molybdenum	SW-846	Temperature	Field Measure
Selenium	SW-846		

6.3 Pretreatment Limitations Spreadsheet

Revised local limits for the parameters were developed using the USEPA Pretreatment Limitations Spreadsheet, in conjunction with USEPA's available guidance documents. The spreadsheet first calculates a maximum allowable headworks loading (MAHL) for each parameter by evaluating several different criteria and selecting the one that results in the most stringent allowable loading. The criteria evaluated by the spreadsheet include NPDES effluent limits, water quality criteria, and sludge disposal criteria which are inputs to the spreadsheet. The calculation is based on the criteria and the associated removal efficiency for each parameter.

Once the maximum allowable headworks loading is calculated, the spreadsheet determines the maximum allowable industrial loading, which is the portion of the allowable headworks loading allocated for industrial dischargers. This is done by accounting for both a user-specified safety/expansion factor and the current loadings from uncontrolled (non-industrial) sources.

The maximum allowable industrial loading can then be allocated to the industrial discharges via several different approaches. In the case of MSANK, the allocation was done based on the Uniform Concentration Limit approach. This approach involves dividing the maximum allowable industrial loadings by the total industrial flow to calculate concentration limits, which are then applied uniformly to all industrial dischargers.

The specific inputs used in the spreadsheet and the resulting outputs are described below. A CD and a copy of the printouts from the spreadsheet used to generate the local limits for MSANK are included in **Appendix B.** The printouts include a summary of the input values as well as the calculation results.

6.4 Spreadsheet Input Data

A. Wastewater Unit Operations & Effluent Disposal

The following major elements of MSANK's treatment process were identified in the spreadsheet:

* Primary Clarification,
* Activated Sludge,
* Anaerobic Digestion, and
* Discharge to fresh water stream.

These inputs allow the model to determine applicable criteria.

B. Plant Flow Information

The spreadsheet requires four average daily flow values: the total influent flow, the influent flow received from industrial contributors, the non-industrial influent flow, and the flow of sludge to the digesters.

Historical flow data from 2006-2011 was used to determine the influent flow. The average total daily influent flow was 6.001 MGD. The current NPDES permit allows for an average daily flow of 6.0 MGD. Flows exceeding this amount are due to the combined nature of the sewage system. Heavy rains will elevate flows but also dilute contaminants minimizing their effect on the plant's discharge.

The average daily Industrial Flow value used in the model was the sum of the average discharge flows from both the significant and non-significant industrial users based on MSANK flow records for 2011. The average flow from the SIUs totaled 0.54 MGD, while the flows from the non-significant industrial users were estimated at 0.048 MGD. Based on these flow amounts, the total Industrial Flow used in the spreadsheet was 0.588 MGD and the total Non-Industrial flow was 5.413 MGD.

The Sludge to Digester flow rate was based on data collected during the month proceeding the five day sample collection. An average sludge to digester flow rate of 0.037 MGD was used in spreadsheet.

C. Receiving Water Flows

Although the facility discharges to Pucketa Creek, the PADEP considers it a direct discharge to the Allegheny River from a water quality standpoint because of the close proximity of the discharge to the river. Thus, the Allegheny River was considered the receiving stream for purposes of calculating revised local limits for the POTW.

The spreadsheet requires a receiving water dilution ratio based on the 7Q10 flow rate of the receiving stream. The flow rates used for the Allegheny River included a 7Q10 of 1,874 MGD (2,900 cfs) and a Harmonic Mean Stream Flow of 5,099 minutes. These receiving water flow rates are consistent with those used to develop the existing local limits. It was assumed that, in both cases, 100% of the receiving water flow is available for dilution. A

Complete Mix Time of 2,779 minutes and an average discharge flow of 6.001 MGD were inputs to the spreadsheet.

D. Sludge Disposal

Dewatered sludge (filter cake) from the facility currently is disposed in a landfill. However, for purposes of calculating the revised local limits and in accordance with EPA guidance documents, exceptional quality sludge criteria were used in the calculation of the updated local limits. The sludge disposal rate input into the spreadsheet was based on the total quantity of dewatered sludge generated in the year 2011, which was 366 dry metric tons or 1 dry metric ton per day.

E. Average Influent Concentrations

The spreadsheet uses average influent concentrations in order to provide a comparison of the calculated maximum allowable loadings to the actual influent loadings. The average influent concentrations were based on the 5 days of influent data collected as part of the Headworks Analysis Sampling Plan and the quarterly data collected from years 2006-2011. When calculating the averages, measurements reported as non-detectable were assumed to be equal to one half of the detection limit.

F. Average Non-Industrial Concentrations

The average non-industrial concentrations for all parameters were based on the 5 days of "background" sampling data collected as part of the Headworks Analysis Sampling Plan. The "background" samples were collected from residential sections of the MSANK service area at points with no known contribution of flow from commercial or industrial dischargers. Measurements reported as non-detectable were assumed equal to one half of the detection limit.

G. NPDES Effluent Limits

Effluent discharge limits can be entered as input to the spreadsheet. For CBOD and TSS, the discharge limits input into the spreadsheet were the monthly average limits in the facility's NPDES permit.

H. Receiving Water Background Concentrations

The background or upstream concentrations in the receiving water were all assumed to be zero. This is consistent with the approach PADEP used in the Fact Sheet for recent permit renewals.

I. Pollutant Levels in Sludge

The average pollutant concentrations in the sludge were based on data collected from the 5 days of sampling collected as part of the Headworks Analysis Sampling Plan and the quarterly data collected from 2006-2011.

J. Sludge Disposal Criteria

The spreadsheet uses sludge disposal criteria to calculate allowable headworks loadings that ensure compliance with applicable sludge disposal criteria. As previously mentioned, MSANK currently sends its dewatered sludge to a landfill. However, in accordance with USEPA guidance, the exceptional quality sludge criteria were used to calculate the updated local limits. These criteria are all expressed in terms of milligrams of pollutant per kilogram of sewage sludge on a dry weight basis.

6.5 Spreadsheet Output Data

Table 4 provides a summary of revised local limits calculated by the spreadsheet based on the use of the input parameters described above and the Uniform Concentration Limit approach. The table also lists the governing condition (i.e., the type of criteria that resulted in the most stringent allowable influent loading). A list of the existing local limits also is included for comparison purposes. A brief discussion of the results obtained for each parameter is provided below.

Existing Local Limit Parameters

1. $CBOD_5$

The existing local limit for $CBOD_5$ is 729 mg/l. The calculated limit for $CBOD_5$ is 1,339 mg/l. MSANK desires to retain their existing local limit of 729 mg/l. Retaining the existing limit is intended to assure compliance with the 25 mg/l monthly average discharge limitation in the facility's NPDES permit.

2. TSS

The existing local limit for TSS is 771 mg/l. The calculated limit for TSS is 1,397 mg/l. Consistent with the $CBOD_5$ parameter, MSANK desires to retain the existing local limit to assure compliance with the 30 mg/l monthly average discharge limitation in the facility's NPDES permit.

3. Arsenic

The governing condition in the calculation of the revised local limit for Arsenic was the exceptional quality sludge criterion. The calculated limit for Arsenic was 0.34 mg/l. MSANK desires to retain their existing local limit of 0.11 mg/l.

4. Cadmium

The governing condition in the calculation of the revised local limit for Cadmium was the exceptional quality sludge criterion. The revised local limit for Cadmium is 0.11 mg/l and the existing local limit is 0.2 mg/l. MSANK desires to adopt the revised local limit for Cadmium.

5. Total Chromium

The governing condition in the calculation of the existing and revised local limit for Total Chromium was based on preventing inhibition of the activated sludge process. The revised local limit for Total Chromium is 12.2 mg/l, compared to the existing limit of 13.1 mg/l. MSANK desires to adopt the revised limit of 12.2 mg/l.

6. Copper

The governing condition in the calculation of the revised local limit for Copper was the exceptional quality sludge criterion. The revised local limit for Copper is 0.69 mg/l and the existing local limit is 1.4 mg/l. MSANK desires to adopt the revised local limit for Copper.

7. Total Cyanide

The governing condition in the calculation of the revised local limit for Total Cyanide was based on inhibition of the activated sludge process. The revised local limit for Total Cyanide is 0.12 mg/l, compared to the existing limit of 0.17 mg/l. MSANK desires to adopt the revised limit of 0.12 mg/l.

8. Lead

The governing condition in the calculation of the revised local limit for Lead was the exceptional quality sludge criterion. The revised local limit for Lead is 0.17 mg/l and the existing limit is 2.31 mg/l. MSANK desires to adopt the revised local limit for Lead.

9. Mercury

The governing condition in the calculation of the revised local limit for Mercury was the exceptional quality sludge criterion. The revised local limit for Mercury is 0.016 mg/l and the existing limit is 0.019 mg/l. MSANK desires to adopt the revised local limit for Mercury.

10. Nickel

As discussed previously, MSANK is currently disposing of the sludge at a landfill however MSANK is interested in attaining the clean sludge criteria goals in order to enable an application to be submitted to the PA Department of Environmental Protection to request approval to distribute exceptional quality sludge. In recent history, the Nickel and Zinc concentrations in the sludge exceed the clean sludge goals for those parameters. The revised local limits for Nickel and Zinc were calculated differently from the other parameters. When the analytical results for Nickel and Zinc that were more than two standard deviations from the other data were eliminated from the calculations, the resulting limits inferred higher removal efficiencies than are actually the case based on historical sludge data. Since it is desired to have limits for Nickel and Zinc that represent actual removal efficiencies, the outlier data was included in the calculations. Additionally, the criteria in Table 3 of the spreadsheet were changed from influent / effluent to influent / sludge for Nickel and Zinc to be more representative of actual conditions.

The governing condition in the calculation of the revised local limit for Nickel was the exceptional quality sludge criterion. The revised local limit for Nickel is 0.22 mg/l and the existing limit is 0.72 mg/l. MSANK desires to adopt the revised local limit for Nickel.

11. Silver

The governing condition in the calculation of the revised local limit for Silver was water quality. The revised local limit for Silver was 1.30 mg/l. The existing local limit for Silver is 0.56 mg/l. MSANK desires to retain the existing local limit for Silver.

12. Zinc

As referenced previously the calculations for Nickel and Zinc were different than other parameters. The governing condition in the calculation of the revised local limit for Zinc was the exceptional quality sludge criterion. The revised local limit for Zinc is 1.99 mg/l and the existing limit is 2.77 mg/l. MSANK desires to adopt the revised local limit for Zinc.

13. pH

The pH of the influent collected during the Headworks Analysis Sampling Program ranged from a minimum of 7.1 s.u. to a maximum of 7.6 s.u. The pH of the effluent during this time period ranged from a minimum of 6.6 to a maximum of 7.5 s.u. The pH of the background samples during this time period ranged from a minimum of 6.8 to a maximum of 7.1 s.u.

Review of daily pH measurements of the MSANK treatment plant effluent during 2011 indicates the effluent pH ranged from a minimum of 6.5 to a maximum of 7.7 s.u. MSANK desires to retain their existing pH limits of 6.0-11.5 s.u.

14. Oil and Grease

The spreadsheet was not used to calculate a limit for Oil and Grease due to lack of criteria upon which to develop a revised local limit. The existing surcharge local limit for Oil and Grease appears to be based on criteria found in Section 3.10(h) of the MSANK Rules and Regulations Governing Sewage Services. The existing surcharge limit of 100 mg/l and fine limit of 500 mg/l are believed sufficient to protect the treatment system from obstruction of flow in the sewer and interference with treatment plant operations therefore MSANK desires to retain these limits.

15. Temperature

The spreadsheet was not used to calculate a limit for Temperature due to lack of criteria upon which to develop a revised local limit. The existing local limit for Temperature appears to be based on criteria found in Section 3.10(a) the MSANK Rules and Regulations Governing Sewage Services (1975, as amended). The existing limit of 150 F is believed to provide sufficient protection such that wastewater at the introduction of the treatment plant does not exceed a temperature of 104 F, so as not to inhibit biological activity in the treatment plant resulting in pass-through or interference.

7.0 RESULTS AND DISCUSSION

7.1 Results of Spreadsheet

Results of the spreadsheet using exceptional quality sludge criteria indicate that limits for Arsenic, Silver, CBOD and TSS were less stringent but MSANK desires to retain the existing limits for these parameters. The limits for Cadmium, Total Chromium, Copper, Total Cyanide, Lead, Mercury, Nickel, Selenium and Zinc were more stringent and MSANK desires to implement the lower limits. The differences in the limits are attributed to differences in sludge criteria, flow values, and removal efficiencies used in the calculations.

7.2 Limits Applicable to Keystone Rustproofing, Inc.

Keystone Rustproofing is regulated under Electroplating categorical limits in 40 CFR 413.14(c)-Pretreatment Standards for Existing Sources and under Metal Finishing categorical limits in 40 CFR 413.17 (a)-Pretreatment Standards for New Sources. The combined waste stream formula was used to calculate limits that were imposed in Keystone's permit starting in 2009. The daily maximum local limits for all parameters except chromium were more stringent than the limits calculated using the combined waste stream formula and were imposed in the permit. The combined waste stream formula limit for daily maximum chromium was imposed in the permit. Since MSANK does not impose monthly average local limits, the monthly average limits calculated using the combined waste stream formula were imposed in the permit.

Consistent with 2009, the 2012 daily maximum local limits for all parameters except chromium were more stringent than the limits calculated using the combined waste stream formula and will be imposed in the permit. The combined waste stream formula limit for daily maximum chromium will be imposed in the permit. Since MSANK does not impose monthly average local limits, the monthly average limits calculated using the combined waste stream formula will be imposed in the permit. See **Table 5** for the combined waste stream limits calculated using Keystone Rustproofing 2012 flow data.

Industrial Pretreatment Program

Pretreatment Year 2011
Significant Industrial Users Regulated Under Pretreatment Permits

SIGNIFICANT / MAJOR / CATEGORICAL

	Name of Industry	SIC Code	Pretreatment Classification	Description of Operations
1	Keystone Rustproofing Inc.	3471	Significant/Major Categorical	Surface Treatments and Protective Coatings for Metal components. Processes include electroplating, anodizing and metallic conversion coatings

SIGNIFICANT / MAJOR / NONCATEGORICAL

2	Farmland Foods (North Side Foods)	2013	Significant/Major Noncategorical	Process raw pork, beef, and turkey into pre-cooked sausage, bacon, and meatballs.
3	Unifirst Corporation	7218	Significant/Major Noncategorical	Uniform rental, servicing and laundering operation

SIGNIFICANT / MINOR / NONCATEGORICAL

4	Castle CoPacking, Inc.	2086	Significant/Minor Noncategorical	Beverage bottling
5	Citizens Ambulatory Care Center (former Citizens General Hospital)	8062	Significant/Minor Noncategorical	Inpatient and outpatient treatment
6	Schreiber Industrial Development Company	9999	Significant/Minor Noncategorical	Managers of an Industrial Park with approximately 24 industries.

Total Metals	10.5	6.8	5	-	-

New Source Calculations

Other Pollutants:

Metal Finishing Regulated Flow = 6,800 gpd (1600+600+3600+1000 = 6,800)

Electroplating Regulated Flow = 14,300 gpd (21,100 - 6,800 = 14,300)

Unregulated Flow = 0 gpd

Dilution = 0 gpd

(Metal Finishing Standard x 6,800 gpd) + (Electroplating Standard x 14,300 gpd) / 21,100 X (21,100 - 0)/ 21,100 gpd)

Cadmium = (0.11x 6,800) + (1.2 x 14,300 gpd)/ 21,100 x 1 = 0.85 mg/l daily maximum

Total chromium = (2.77 x 6,800) + (7.0 x 14,300) / 21,100 x 1 = 5.64 mg/l daily maximum

Copper = (3.38 x 6,800) + (4.5 x 14,300) / 21,100 x 1= 4.14 mg/l daily maximum

Lead = (0.69 x 6,800) + (0.60 x 14,300) / 21,100 x 1= 0.63 mg/l daily maximum

Nickel = (3.98 x 6,800) + (4.1 x 14,300) / 21,100 x 1 = 4.06 mg/l daily maximum

Zinc = (2.61 x 6,800) + (4.2 x 14,300) / 21,100 x 1 = 3.69 mg/l daily maximum

For Silver Daily Maximum

Metal Finishing Regulated Flow = 6,800 gpd (1,600+600+3,600+1,000 = 6,800 gpd)

Electroplating Regulated Flow = 2,500 gpd (1,200 + 1,300 = 2,500 gpd)

Unregulated Flow = 11,800 gpd (21,100 - 6,800 - 2,500 = 11,800 gpd)

Dilution = 0 gpd

Metal Finish silver limit x 6,800 gpd + precious metals electroplating silver limit x 2,500 gpd / regulated flow x Total Flow - dilution flow / total flow

(0.43 x 6,800 gpd) + (1.2 x 2,500) / 9,300 x 21,100 - 0 / 21,100 = 0.64 daily maximum

For Cyanide Daily Maximum

Metal Finishing Regulated Flow = 2,500 gpd (1,200 + 1,300 = 2,500 gpd)

Electroplating Regulated Flow = 14,300 gpd (21,100 - 6,800 = 14,300 gpd)

Unregulated Flow = 0 gpd

Dilution = 2,600 gpd (1,600+1,000 = 2,600 gpd)

(Metal Finish cyanide limit x metal finish regulated flow) + (electro cyanide limit x electro flow) / electro regulated flow X (Total Flow - dilution flow)/dilution flow

(1.2 x 2,500 gpd) + (1.9 x 14,300 gpd) / 14,300 X (21,100 - 2,600)/ 21,100 = 1.85 mg/l daily maximum

For Silver Monthly Average

Metal Finishing Regulated Flow = 6,800 gpd (3,600+600+1,600+1,000 = 6,800 gpd)

Electroplating Regulated Flow = 2,500 gpd (1,300 + 1,200 = 2,500 gpd)

Unregulated Flow = 11,800 gpd (21,100 - 6,800 - 2,500 = 11,800 gpd)

Dilution = 0 gpd

(monthly average metal finish limit x metal finish regulated flow) + (adjusted average electro limit x electro flow) /Total Regulated flow X (total flow - dilution flow) / total flow

(0.24 x 6,800 gpd) + (0.5 x 2,500 gpd)/ 9,300 gpd X 21,100 - 0 / 21,100) = 0.31 mg/l silver monthly average

For Cyanide Monthly Average
Metal Finishing Regulated Flow = 2,500 gpd
Electroplating Regulated Flow = 14,300 gpd
Unregulated Flow = 0 gpd
Dilution = 2,600 gpd

(monthly average metal finishing limit x metal finish regulated flow) + (adjusted average electro limit x electro flow) / (electroplating regulated flow X (total flow - dilution flow) / total flow
(0.65 x 2,500 gpd) + (0.55 x 14,300 gpd)/ 14,300 gpd X (21,100 pgd - 2,600 gpd)/ 21,100 gpd = 0.58 mg/l

Other Pollutants:
Monthly Average
Metal Finishing Regulated Flow = 6,800 gpd
Electroplating Regulated Flow = 14,300 gpd
Dilution = 0 gpd

(Metal Finishing Standard x 6,800 gpd) + (Electroplating Standard x 14,300 gpd) / 21,100 x (21,100 - 0)/ 21,100 gpd)
Cadmium = (0.07x 6,800) + (0.5 x 14,300 gpd)/ 21,100 x 1 = 0.36 monthly average
Total chromium = (1.71 x 6,800) + (2.5 x 14,300) / 21,100 x 1 = 2.25 mg/l monthly average
Copper = (2.07 x 6,800) + (1.8 x 14,300) / 21,100 x 1= 1.89 mg/l monthly average
Lead = (0.43 x 6,800) + (0.3 x 14,300) / 21,100 x 1= 0.34 mg/l monthly average
Nickel = (2.38 x 6,800) + (1.8 x 14,300) / 21,100 x 1 = 1.99 mg/l monthly average
Zinc = (1.48 x 6,800) + (1.8 x 14,300) / 21,100 x 1 = 1.70 mg/l monthly average

Headworks Analysis Sampling Plan and USEPA Approval Letter

UNITED STATES ENVIRONMENTAL PROTECTION AGENCY
REGION III
1650 Arch Street
Philadelphia, Pennsylvania 19103-2029

Mr. Daniel H. Rowe, Jr., Manager
The Municipal Authority of the City of New Kensington
120 Logans Ferry Road
New Kensington, Pennsylvania 15068-2046

SEP 23 2011

Re: Pretreatment Program – Headworks Analysis Sampling Plan
NPDES No. PA0027111

Dear Mr. Rowe:

Thank you for your August 8, 2011 submittal of the Headworks Analysis Sampling Plan to Elizabeth Ottinger of our pretreatment staff. My comments are as follows:

Pollutants to be Evaluated – The list you provided appears to include all of the pollutants of concern that EPA normally proposes to be covered. The only additional pollutants would be any priority pollutants that were determined in the priority pollutant scan, or any pollutants discharged from a User that were not previously accounted for. See the enclosure for further guidance.

Sampling Points – No comments warranted.

Number and Type of Sampling Events – No comments warranted.

Analytical Methods/Detection Levels – No comments warranted.

Schedule – Since EPA was a little late in reviewing this, and the Sample Collection was to start in September 2011, you can begin the sample collection as soon as possible. I will be e-mailing a copy of this letter to you today, in addition to providing a hard copy.

Please proceed with the sampling and data collection. If you have any questions or comments, feel free to contact Liz Ottinger at (215) 814-5783, or me at (215) 814-5792.

Sincerely,

Stephen G. Copeland
NPDES Permits Branch (3WP41)
Water Protection Division

HEADWORKS ANALYSIS SAMPLING PLAN

A. Pollutants to be Evaluated

MSANK proposes to evaluate a total of eighteen parameters as part of the Headworks Analysis. The Headworks Analysis evaluation will consist of the "standard ten" parameters including Arsenic, Cadmium, Chromium, Copper, Cyanide, Lead, Mercury, Nickel, Silver and Zinc. Molybdenum and Selenium will also be evaluated due to their inclusion in EPA's and Pennsylvania sludge quality program. MSANK also has local limitations for Carbonaceous Biochemical Oxygen Demand, Total Suspended Solids, Hexavalent Chromium, Oil and Grease, Temperature and pH. No additional toxic pollutants are listed in the NPDES permit, nor have other priority pollutants been detected at significant levels during the priority pollutant scans conducted during the quarterly monitoring required by the Pretreatment Program.

B. Sampling Points

MSANK proposes the use of five sampling locations to conduct the Headworks Analysis. The proposed sampling locations are:

1. Raw Influent – the raw influent samples will be collected prior to the influent combining with any recycle or other internal waste streams.

2. Influent to Digester

3. Final Effluent

4. Background samples solely from domestic sources - MSANK applies the local limitations to commercial as well as industrial facilities within the service area. The Municipal Water Authority of the City of New Kensington is the sole supplier of potable water within the MSANK service area. MSANK proposes to collect background samples from sewer segments located in residential sections of Lower Burrell, the City of Arnold and the City of New Kensington. The background samples will be collected on the same days that the Influent and Effluent samples are collected.

5. Sludge

C. Number and Type of Sampling Events

1. Historical Sample Data

MSANK proposes to use historical monitoring data from years 2006 to 2010 to supplement the samples to be collected for the Headworks Analysis.

2. Proposed Sample Data

In order to assess current plant conditions, MSANK proposes to supplement the referenced historical data by conducting sampling on a daily basis for a five-day period. Grab samples will be collected for Cyanide, Hexavalent Chromium, and

Oil and Grease. Temperature and pH will be evaluated through on-site testing procedures. All other parameters will be evaluated using 24-hour composite samples. Proposed sample data includes the following:

a. Raw Influent and Final Effluent

Five, 24-hour composite samples of the Raw Influent and Final Effluent samples will be collected for analysis. These samples will be analyzed for the eighteen parameters referenced previously.

b. Influent to Digester

A total of five daily grab samples of Influent to Digester will be collected and analyzed for the non-conservative parameter of Cyanide. The samples will be collected on days when Influent and Effluent samples are being collected.

c. Background

Six, 24-hour composite samples of Background wastewater from domestic sources will be analyzed for the eighteen parameters referenced previously. Two samples will be collected from a background sampling location in New Kensington, two samples will be collected from a sampling location in Arnold and two samples will be collected from a sampling location in Lower Burrell.

d. Sludge

Five samples of sludge will be collected from the belt filter press area at the treatment plant. In order to obtain a representative sample, grab samples of sludge will be collected and then combined to form a single composite sample of sludge that will be analyzed for the eighteen parameters referenced previously. One composite sample of sludge will be collected per day, over a five-day period. Sludge samples will be collected on days when Influent and Effluent samples are being collected.

D. Analytical Methods/Detection Levels

MSANK proposes to conduct all pollutant analyses using EPA methodology with the most sensitive detection levels available for each method. A listing of the parameters and the proposed analytical methods are as follow:

Parameter	Analytical Method	Parameter	Analytical Method
Arsenic	SM18 3113B	Total Suspended Solids	SM18 2540D
Cadmium	EPA 200.8	Hexavalent Chromium	EPA 218.4
Chromium	EPA 200.8	Oil and Grease	EPA 1664A
Copper	EPA 200.7	pH	EPA 150.1
Cyanide	EPA 335.3	Lead	SM18 3113B

Parameter	Analytical Method	Parameter	Analytical Method
Mercury	SM18 3112B	Temperature	SM18 2550B
Nickel	EPA 200.8	Carbonaceous Biochemical	
Silver	EPA 272.2	Oxygen Deman d	EPA 405.1
Zinc	EPA 200.7		
Molybdenum	EPA 200.8		
Selenium	SM18 3114B		

E. Schedule

MSANK proposes to conduct the required headworks analysis under the following schedule:

Sample Collection	September 2011
Evaluation of Sample Collection Data	October 2011
Headwork Analysis / Local Limits Reevaluation	November 2011
Submission of Local Limits Reevaluation to EPA	December 2011

Appendix B

Allowable Headworks (ACT. SLUDGE) from Table 8, column E.
Allowable Headworks (TRICK. FILTER) from Table 9, column E.
Allowable Headworks (NITRIF.) from Table 10, column E.
Allowable Headworks (DIG. - CONSERV.) from Table 11 column F.
Allowable Headworks (DIG. - NON_CONS.) from Table 12, column G.
Most Stringent (INHIBITION) is lowest value from columns B through F.

(Cmaxin) Maximum Influent Concentration (from 'Monitoring Data' sheet, row 44).
(Lmaxin) Maximum Influent Loading (calculated).
Lmaxin = 8.34 * Cmaxin * Qpotw
8.34 Unit conversion factor
(Qpotw) POTW's average flow in MGD (from Table 2(b), cell B36).

Allowable Headworks (INHIBITION) is highest value from column G or I.
Red Bold indicates that the allowable headworks loading is based on the maximum influent loading.

(Qinc) Average sludge flow to incinerator in dry metric tons per day (from Table 2(b), cell M36).
(DF) Incinerator dispersion factor in ug/m³/g/sec (from Table 2(b), cell L36).
(CE) Incinerator control efficiency for the pollutant as a percent (user entered).
(RSC) Risk specific concentration limit in ug/m³ (from 40 CFR 503.43(d) - Table 1 for arsenic, cadmium, and nickel; Table 2 for chromium; chromium user entered).
(NAAQS) National ambient air quality standard in ug/m³ (from 40 CFR 50.12).
(NESHAP) National emission standard in g/d (from 40 CFR 61.52(b) for mercury and 40 CFR 61.32(a) for beryllium).
(Qpotw) POTW's average flow in MGD (from Table 2(b), cell B36).
(Qsldg) Average sludge flow to disposal in dry metric tons per day (from Table 2(b), cell E36).
(Cslcrit) Applicable sludge standard in mg/kg dry sludge (calculated based on RSC, NAAQS, or NESHAP - see individual cells for formulas or Appendix T of EPA local limits guidance manual).
86400 Unit conversion factor
(Rpotw) Removal efficiency across POTW as a percent (from Table 3, column E).
(Lhw) Maximum allowable headworks pollutant loading to the POTW in pounds per day (lbs/day - calculated).
Lhw = (0.0022 * Cslcrit * Qsldg) / (Rpotw/100)
0.0022 Unit conversion factor

(MAHL) Maximum allowable headworks loading (from Table 17, column F).
(SF) Safety factor as a percent (user entered).
(GA) Growth allowance as a percent (user entered).
(Cdom) Average domestic/commercial background concentration for a particular pollutant in mg/l (from 'Monitoring Data sheet row 43 or user entered).
(Qdom) Average domestic/commercial background flow in MGD (calculated).
Qdom = Qpotw - Qind - Qhw (values from Table 2(b), cells B36, C36, and K36)
(Ldom) Average domestic/commercial background loading to the POTW for a particular pollutant in pounds per day (calculated).
Ldom = 8.34 * Cdom * Qdom
8.34 Unit conversion factor
(Chw) Average hauled waste concentration for a particular pollutant in mg/l (from "Monitoring Data" sheet, row 43 or user entered).
(Qhw) Average hauled waste flow in MGD (from Table 2(b), cell K36).
(Lhw) Average hauled waste loading to the POTW for a particular pollutant in pounds per day (calculated).
Lhw = 8.34 * Chw * Qhw
(MAIL) Maximum Allowable Industrial Load (calculated).
MAIL = MAHL * (1 - SF) - Ldom - Lhw
(Cind) Industrial allowable local limit for a given pollutant in mg/l (calculated).
Cind = MAIL/(8.34 * Qind)
Basis of Limitation is an identification of the lowest allowable headworks loading from Table 17.
Existing Local Limit from Table 3, column B.
Red Bold indicates a safety factor or growth allowance of less than 10%.

POTW Name:

(MAILex) = Existing Maximum Allowable Industrial Load (user entered).
(MAIL) = Maximum Allowable Industrial Load (from Table 18, column K).
(Cind-ex) = Existing local limit for a given pollutant in mg/l (user entered).
(Cind) = Newly calculated local limit for a given pollutant in mg/l (from Table 18, column L).

Brown bold indicates that the calculated allowable industrial loading or local limit is less stringent than the existing loading or limit.
Green bold indicates that the calculated allowable industrial loading or local limit is new or more stringent than the existing loading or limit.
Red bold indicates that the proposed local limit is less stringent than the calculated limit.
Basis of "Need Limit?": "X" in "Existing Limit" column indicates that a local limit exists but no limit was proposed.
Basis of "Need Limit?": "X" in "Avg Inf Loading" column indicates that the average influent loading is greater than 60% of the MAHL.
Basis of "Need Limit?": "X" in "Max Inf Loading" column indicates that the maximum influent loading is greater than 80% of the MAHL.

POTW Name:

Local Limit

TABLE 20 - Comparison of Allowable Headworks Loadings And Current Influent Loadings

(MAHL) Maximum Allowable Headworks Loading (from Table 17).
Average Influent Loading from 'Monitoring Data' sheet row 46.
Average Percent Loaded = (Average Influent Loading)/(Maximum Allowable Headworks Loading)*100
Maximum Influent Loading is the Maximum Influent Concentration from 'Monitoring Data' sheet row 44 converted to a loading using the POTW flow from Table 2(b).
Maximum Percent Loaded = (Maximum Influent Loading)/(Maximum Allowable Headworks Loading)*100
Green bold indicates that the average percent loaded is greater than 60% or the maximum percent loaded is greater than 80%.
Red bold indicates that the percent loaded is greater than 100%.

(MAHL)	Maximum allowable headworks loading (from Table 18).
(Qpotw)	POTW's average flow in MGD (from Table 2(b), cell B36).
(MAHC)	Influent concentration necessary to meet effluent, sludge, and inhibition goals (calculated).
MAHC =	MAHL/(Qpotw * 8.34)
8.34	Unit conversion factor
(AHLwq)	Allowable Headworks (WATER QUALITY) from Table 7, column F.
(Rpotw)	Removal efficiency across POTW as percent (from Table 3, column F).
(Effluent Goal)	Discharge concentration necessary to meet NPDES limit or water quality standards (calculated)
Effluent Goal =	(AHLwq) * (1-Rpotw/100)/(8.34 * Qpotw)
(AHLs)	Allowable Headworks (SLUDGE) from Table 16, column D.
(Qsldg)	Average sludge flow to disposal in dry metric tons per day (from Table 2(b), cell E36).
(Sludge Goal)	Sludge standard used in headworks calculations for sludge protection (calculated)
Sludge Goal =	AHLs * (Rpotw/100) / (0.0022 * Qsldg)

Evaluation = OK means that all of the monitoring data is below the goal.
Evaluation = ? means that 25% or less of all of the monitoring data is above the goal.
Evaluation = II means that between 25% and 50% of all of the monitoring data is above the goal.
Evaluation = IIII means that between 50% and 75% of all of the monitoring data is above the goal.
Evaluation = IIIII means that more than 75% of all of the monitoring data is above the goal.
Evaluation = "-" means that there is no goal or no monitoring data was used in the evaluation.
(Influent Goal) Influent concentration necessary to meet effluent, sludge, and inhibition goals (from Table 20).
(Effluent Goal) Discharge concentration necessary to meet NPDES limit or water quality standards (from Table 20).
(Sludge Goal) Sludge concentration necessary to meet sludge disposal goals (from Table 20).
Number of Measurements (columns C, G, and K) from 'Monitoring Data' sheet row 42.
Number of Exceedances (columns D, H, and L) is the number of sample results in 'Monitoring Data' sheet (rows 2 through 41) that exceed the listed goal.

TABLE 20 - Comparison of Allowable Headworks Loadings And Current Influent Loadings

(MAHL) Maximum Allowable Headworks Loading (from Table 17).
Average Influent Loading from 'Monitoring Data' sheet row 46.
Average Percent Loaded = (Average Influent Loading)/(Maximum Allowable Headworks Loading)*100
Maximum Influent Loading is the Maximum Influent Concentration from 'Monitoring Data' sheet row 44 converted to a loading using the POTW flow from Table 2(b), cell B36.
Maximum Percent Loaded = (Maximum Influent Loading)/(Maximum Allowable Headworks Loading)*100
Green bold indicates that the average percent loaded is greater than 60% or the maximum percent loaded is greater than 80%.
Red bold indicates that the percent loaded is greater than 100%.

(MAHL) Maximum allowable headworks loading (from Table 17, column F).
(SF) Safety factor as a percent (user entered).
(GA) Growth allowance as a percent (user entered).
(Cdom) Average domestic/commercial background concentration for a particular pollutant in mg/l (from 'Monitoring Data sheet row 43 or user entered).
(Qdom) Average domestic/commercial background flow in MGD (calculated).
Qdom = Qpotw - Qind - Qhw (values from Table 2(b), cells B36, C36, and K36)
(Ldom) Average domestic/commercial background loading to the POTW for a particular pollutant in pounds per day (calculated).
Ldom = 8.34 * Cdom * Qdom
8.34 Unit conversion factor
(Chw) Average hauled waste concentration for a particular pollutant in mg/l (from "Monitoring Data" sheet, row 43 or user entered).
(Qhw) Average hauled waste flow in MGD (from Table 2(b), cell K36).
(Lhw) Average hauled waste loading to the POTW for a particular pollutant in pounds per day (calculated).
Lhw = 8.34 * Chw * Qhw
(MAIL) Maximum Allowable Industrial Load (calculated).
MAIL = MAHL * (1 - SF) - Ldom - Lhw
(Cind) Industrial allowable local limit for a given pollutant in mg/l (calculated).
Cind = MAIL/(8.34 * Qind)
Basis of Limitation is an identification of the lowest allowable headworks loading from Table 17.
Existing Local Limit from Table 3, column B.
Red Bold indicates a safety factor or growth allowance of less than 10%.

Evaluation = OK means that all of the monitoring data is below the goal.
Evaluation = ? means that 25% or less of all of the monitoring data is above the goal.
Evaluation = !! means that between 25% and 50% of all of the monitoring data is above the goal.
Evaluation = !!!! means that between 50% and 75% of all of the monitoring data is above the goal.
Evaluation = !!!!!! means that more than 75% of all of the monitoring data is above the goal.
Evaluation = "-" means that there is no goal or no monitoring data was used in the evaluation.
(Influent Goal) Influent concentration necessary to meet effluent, sludge, and inhibition goals (from Table 20).
(Effluent Goal) Discharge concentration necessary to meet NPDES limit or water quality standards (from Table 20).
(Sludge Goal) Sludge concentration necessary to meet sludge disposal goals (from Table 20).
Number of Measurements (columns C, G, and K) from 'Monitoring Data' sheet row 42.
Number of Exceedances (columns D, H, and L) is the number of sample results in 'Monitoring Data' sheet (rows 2 through 41) that exceed the listed goal.
